Formal methods:

- ① Allow to *specify* software behaviour formally;
- ② Allow to *prove* that software conforms to specification;
- ③ Allow to *run* the software with the proven properties;

Formal methods:

- 1 Allow to *specify* software behaviour formally;
- 2 Allow to *prove* that software conforms to specification;
- 3 Allow to *run* the software with the proven properties;

```
function Build_Group (E : Ring_Element) return Group  
  with  
  Post => Is_Group (Build_Group' Result);
```

Formal methods:

- 1 Allow to *specify* software behaviour formally;
- 2 Allow to *prove* that software conforms to specification;
- 3 Allow to *run* the software with the proven properties;

```
function Is_Group (G : Group) return Boolean
is (Has_Identity (G) and then
    All_Elements_Have_Inverses (G) and then
    Is_Closed_On_Multiplication (G)
)
```

Formal methods:

```
function Is_Group (G : Group) return Boolean
is (Has_Identity (G) and then
    All_Elements_Have_Inverses (G) and then
    Is_Closed_On_Multiplication (G)
)
```

```
function Belongs_To (E : Element; G : Group) return Boolean
is (for some F of G => (E = F))
```

A non-exhaustive list of tools:

- ① Proof assistants
 - Isabelle/HOL;
 - Coq/Gallina;
- ② Software development systems (proovers)
 - Ada/SPARK
 - C#/Spec#;
 - C/Frama-C;
 - Daphny/Boogie;
 - Java/KeY;
 - Java/JML;
 - Java/EST;
 - Java/Sooth+ByteBack+Boogie

A non-exhaustive list of tools:

- ① Proof assistants
 - Isabelle/HOL;
 - Coq/Gallina;
- ② Software development systems (proovers)
 - **Ada/SPARK**
 - C#/Spec#;
 - C/Frama-C;
 - Daphny/Boogie;
 - Java/KeY;
 - Java/JML;
 - Java/EST;
 - Java/Sooth+ByteBack+Boogie

Why Ada/SPARK?

- 1 Durable design – first designed in 1983!
- 2 Modern language – latest standard is Ada 2022;
- 3 Mostly backwards compatible;
- 4 Good F/LOSS compiler available – GNAT;
- 5 Ada is statically very strictly typed;
- 6 Programs are easy to read (Level (Ada) > Level (C));
- 7 Ada & SPARK has a rich type system;
- 8 Language level concurrent programming;
- 9 Produces fast optimised native code, links with any language;
- 10 SPARK subset takes computer arithmetic into account;
- 11 Not controlled by any private company;

Why is Ada not popular (yet)?

- 1 The language is complex and difficult to implement;
- 2 No good compilers in the 1990's;
- 3 Procured by the DOD, used for “war fighting software”;
- 4 Poor academic outreach in the 20th century;

Why is Ada not popular (yet)?

- 1 The language is complex and difficult to implement;
- 2 The language is rich and convenient to program/design in;
- 3 ~~No good compilers in the 2020's;~~
- 4 Very nice compiler and dev. system available: gnat;
- 5 Procured by the DOD, used for “war fighting software”;
- 6 Used for mission-critical software (avionics, spacecraft ctrl., railways, plant ctrl...)
- 7 Poor academic outreach in the 21st century;
- 8 SPARK allows formal verification of the code (!);

Why is Ada not popular (yet)?

- 1 ~~The language is complex and difficult to implement;~~
- 2 The language is rich and convenient to program/design in;
- 3 ~~No good compilers in the 2020's;~~
- 4 Very nice compiler and dev. system available: gnat;
- 5 Procured by the DOD, used for “war fighting software”;
- 6 Used for mission-critical software (avionics, spacecraft ctrl., railways, plant ctrl...)
- 7 Poor academic outreach in the 21st century;
- 8 SPARK allows formal verification of the code (!);

The algorithm to work with

The group reconstruction algorithm: generate, when presented with a subset of elements from some existing finite group G , a (smallest) subgroup $H \leq G$ containing those elements:

$$\{g_1, \dots, g_n\}, \forall g_i : g_i \in G \rightarrow H \leq G : \text{Is_Group}(H) \wedge \forall g_i : g_i \in H$$

Uses of this algorithm:

- check symmetry operators of a CIF file (for the COD);
- determine symmetry of special position;
- check whether an atom is on a sp. pos.;
- constrain an atom to a sp. pos. for refinement (PD?);
- analyse disorder around a special position;

(Grosse-Kunstleve 1999)

Formal proofs of the the algorithms in use

Require: H – a subgroup of a finite group G

Require: g – an element of the finite group G , $g \in G$

Ensure: The list L of the operators of a subgroup $L \leq G$ without duplicates

Ensure: L contains both g and the elements of H

```
1: procedure SIMPLEBUILDER( $H, g$ )
  ▷ Build a space group generated by  $H$  and  $g$ 
2:    $L \leftarrow [e, h_1, h_2, \dots, h_n]$ , where  $\forall i. h_i \in H$ 
3:    $L_{\text{new}} \leftarrow [g]$ 
4:   while  $L_{\text{new}}$  is not empty do
5:      $g' \leftarrow \text{head}(L_{\text{new}})$ 
6:      $L_{\text{new}} \leftarrow \text{tail}(L_{\text{new}})$ 
7:      $L \leftarrow \text{append}(L, g')$ 
8:     for all  $h' \in L$  do
9:        $g'' \leftarrow h' \otimes g'$ 
10:      if  $g'' \notin L \cup L_{\text{new}}$  then
11:         $L_{\text{new}} \leftarrow \text{append}(L_{\text{new}}, g'')$ 
12:      end if
13:    end for
14:  end while
15:  return  $L$ 
16: end procedure
```

Figure 2

The optimized simple space-group-builder (core) algorithm.

```
1: have "subgroup  $R \leq G$ "
2: proof -
3:   have R_subset: " $R \subseteq \text{carrier } G$ " sorry
4:   moreover have R_m_closed: " $\wedge x y. [x \in R; y \in R] \implies x \otimes y \in R$ " sorry
5:   moreover have R_one_closed: " $1 \in R$ " sorry
6:   moreover have R_m_inv_closed: " $\wedge x. x \in R \implies \text{inv } x \in R$ " sorry
7:   ultimately show "subgroup  $R \leq G$ " by (simp add: subgroup_def)
8: qed
```

```
for my $group_symop (@{$self->{symops}}) {
  do {
    my $product =
      snap_to_crystallographic(
        symop_modulo_1(
          symop_mul( $group_symop, $test_symop )
        )
      );
    my $product_key = string_from_symop( $product );
    if( !exists $self->{symop_hash}{$product_key} ) {
```

saulius@tasmanijos-velnias spacegroups/ $ ./run_make_group 7
(1, 7, 12, 10, 33, 9, 26, 34, 16)
```

Current assumptions

... need to be made

```
function Build_Group (G : Group; E : Ring_Element) return Group
```

```
for I in N'First .. NN loop  
  declare  
    H : Ring_Element := N (I) * T;  
  begin  
    if not Contains (N (N'First..NN), H) then  
      Add_Element (N, NN, H); — Add the element to the growing group  
      Add_Element (L, NL, H); — Add the element to the candidate list  
    end if;  
  end;  
end loop;
```

Current assumptions

... need to be made

```
function Build_Group (G : Group; E : Ring_Element) return Group
```

```
for I in N'First .. NN loop  
  declare  
    H : Ring_Element := N (I) * T;  
  begin  
    if not Contains (N (N'First..NN), H) then  
      Add_Element (N, NN, H); — Add the element to the growing group  
      Add_Element (L, NL, H); — Add the element to the candidate list  
    end if;  
  end;  
end loop;
```

```
pragma Assume (All_Elements_Have_Inverses (Group (N (N'First .. NN))));  
pragma Assume (Is_Closed_On_Multiplication (Group (N (N'First .. NN))));  
  
  return Group (N (N'First .. NN));  
end Build_Group;
```

- Ada/SPARK provide production-ready F/LOSS dev. environment;
- Software functions (Pre/Post) can be formally specified in SPARK;
- Certain properties can be proved automatically; others – with explicit assumptions;
- More properties will be possible to prove in the future;
- Working (library) code can be generated from the verified source;

- A reusable F/LOSS library of *verified* crystallographic algorithms;
- Stable and future-proof;
- Compatible with any languages and platforms (Ada, C(++), Go, Julia, Rust, Perl, Python, WebAssembly, etc.);
- Make software *readable* and *understandable*;
- Make software a part of documentation for *scientific inferences* along with human readable texts (papers, presentations, etc.) and databases (COD, etc.)
